

In the following instructions you'll learn to deploy your frontend and backend for your shopping cart. It's important to note that each end will be deployed separately.

---

Deploy your backend by watching the following tutorial here:

<https://www.youtube.com/watch?v=r2S89Hm1Uq0>

This will generate a url for your backend. You'll use this url to make requests via your front-end client, or react app.

To deploy your frontend watch the video below. Make sure to set up your code so that your react app is making requests to your backend application.

[https://www.youtube.com/watch?v=0kUc\\_Xvc6xs](https://www.youtube.com/watch?v=0kUc_Xvc6xs)

You'll also run into a problem related to the react router when you finish the deployment.

To solve this, search google for where and how to implement a file by the name of `_redirect` as it relates to deploying on netlify.
