This week we'll focus on creating a product card component for each item in your product array.

To start, create a `.js` file in your `src` folder called *productCard.js*

On this file import the following pre-build react-bootstrap components,

```
import { Card, Button, Form, Row, Col } from 'react-bootstrap';
```

Construct a product card that renders the `title` and `price` property for each of the products in your product array.

I recommend using the *Card* and *Button* components to achieve this goal.

Don't worry about matching the design of the finished application yet.

Have each of the product cards rendered in your product `/store` endpoint first and that will be enough at this stage of the project.
