Before we start implementing the useContext hook for our shopping cart, we'll build a modal from a react-boostrap component so our user can checkout.

---

In accordance with the design, add this modal to your navigation bar component, and import the following pre-built bootstrap react component,

```
Import { Modal } from 'react-bootstrap'
```

Within this component add a,

```
<Modal.Header></Modal.Header>
```

Also add a,

```
<Modal.Body></Modal.Body>
```

You'll need a couple events to occur, one event toggles the modal so that it appears, and the other event toggles the modal so that it disappears.

My recommendation is to implement the useState hook to conditionally render the modal.
